

Comments on Docket No. CDC-2022-0111

By: Jane M. Orient, M.D.

To: CDC Advisory Committee on Immunization Practices (ACIP)

October 18, 2022

I strongly oppose recommending any COVID vaccine products for children.

Instead, the Committee should strongly recommend **against** their use, following the example of Denmark and other nations, which have forbidden use in young persons because of the reports of myocarditis.

The acceptable number of cases of cardiac or neurologic injury or future fertility impairment in children, from a prophylactic intervention, is ZERO. Many cases of severe adverse events including death post vaccination have been reported, and the extent of underreporting to the CDC's Vaccine Adverse Event Reporting System (VAERS) is not accurately known, but estimated to be huge, a factor of 10 at a minimum. Experience with genetically engineered mRNA vaccines is too short to see effects on fertility, carcinogenesis, or teratogenesis.

While the adverse events might have been coincidental, there has been no serious attempt to rule out a causal relationship to vaccination.¹

Recommending a product that has serious safety signals, which is unnecessary because of widespread natural immunity and a generally mild disease, and which possibly has negative efficacy, is an egregious violation of regulatory procedures, and a profound violation of public trust.
